

NOVA IMS

Milestone 3 – Validation and Strategic Recommendation

Group 11 – Cold-Climate Logistics Hub Assessment

Milestone 3 – Validation and Strategic Recommendation

Client Update

Following your structured comparative analysis, the logistics company now requires formal statistical validation of your findings before proceeding with the final investment decision.

The objective of this stage is to determine whether the thermal differences identified between Viseu and Bragança are statistically robust and operationally meaningful for a temperature-controlled logistics facility.

Objectives of this Milestone

Your team is expected to:

- Provide statistical validation of key temperature-related differences;
- Assess the robustness of previous interpretations;
- Quantify uncertainty and variability;
- Deliver a structured and evidence-based final recommendation.

Analytical Guidance

At this stage, your analysis may include:

- Statistical hypothesis testing;
- Confidence intervals;

- Regression modeling, when appropriate;
- Quantification of effect size;
- Control for seasonal or monthly variation.

Your objective is not merely to compute statistical metrics, but to interpret them in terms of potential operational implications such as refrigeration demand, energy consumption, and long-term cost efficiency.

Consider questions such as:

- Are observed temperature differences statistically significant?
- Are they practically meaningful for cooling demand?
- Does controlling for seasonality alter the interpretation?
- How stable are the conclusions across different periods?

Final Deliverable

Your final submission must include:

- A clear and explicit strategic recommendation;
- Statistical justification;
- Discussion of uncertainty and limitations;
- Reflection on operational implications for a refrigerated logistics facility.

The client expects a professional conclusion integrating descriptive analysis, quantitative comparison, and formal validation.

Your recommendation must be transparent, defensible, and directly connected to the data.
